

AUTOMOTIVE STORAGE COMPARTMENT AND METHOD FOR MAKING THE SAME

Abstract

An automotive storage compartment comprises a compartment body defining a cavity and having an opening for accessing the cavity. The compartment body includes at least one connecting member integrally formed therein. The storage compartment further includes a cover having at least one connecting member integrally formed therein, the cover connecting member cooperating with the compartment body connecting member to moveably couple the cover to the compartment body. A two-shot molding process may be used to form the storage compartment, with the compartment body and body connecting member being formed in the first shot and the cover and cover connecting member being formed in the second shot so that the cover is pivotally coupled to the compartment body.
